TRIMMING & DFA

Finding Synergies

Dr. Noel León Rovira, Professor Emeritus ITESM, Staff IM&ST

Humberto Aguayo Tellez, Professor ITESM, Staff IM&ST

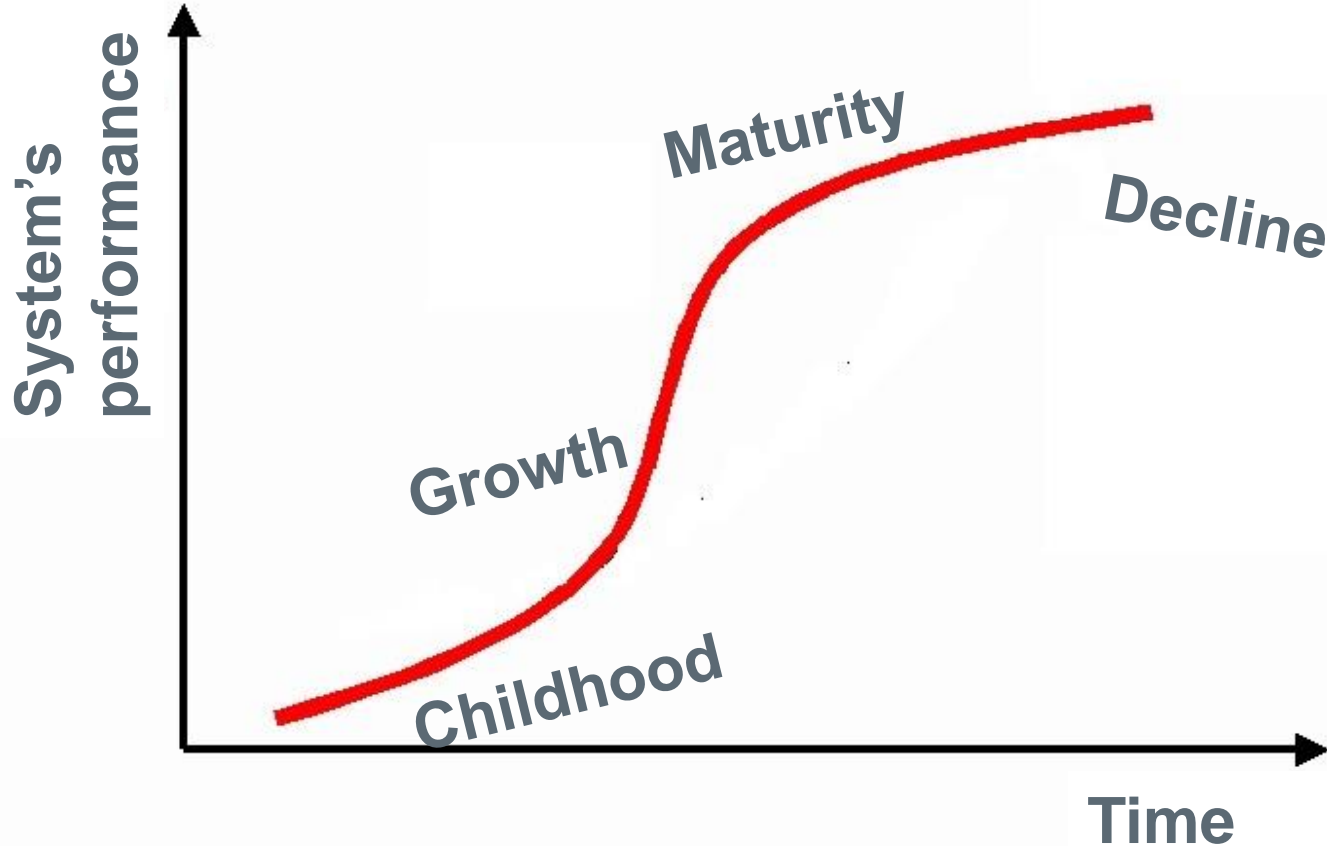

William Hessler, Co-Founder and Chief Engineer of
Tech Spark Innovations, LLC Mechanical Engineer, Inventor

The Primary TRIZ Postulate

- Engineering (technological) systems evolve not randomly, but according to objective patterns developed by Genrich Altshuller (Explained in more detail the paper in the proceedings).
- These patterns can be identified from the patent archives and decisively used for systems development, product design or evolution without numerous blind trials.

1. Stages Of Evolution: When a new product (system) starts its performance is increased at the expense of simplicity, adding supplementary sub-systems. This is the expansion period of the technical system.

- Later evolution is confronted with objective constraints on physical, dated, economical, ecological complications.
- A simplification of the technical system is then required.

- Two techniques are known that help in simplifying:

DFA & Trimming

- Following is a comparison of both techniques, presented looking for possible synergies.

Trimming & Design for Assembly

- **Trimming** is removing elements or replacing parts, features, or the components functions with other constituents.
- **DFA** is related to trimming in that most times you need to remove parts to make product easier to assemble, easier to repair and more competitive.

DFA

Minimum Part Criteria

The main function of Design for Assembly is helping in identifying the ways for simplifying the structure of the systems by minimizing the number of parts and to streamline the assembly, design and or manufacturing processes.

1. Is it the base part, or must the part be separate from other parts for purposes of assembly or disassembly?
2. Does the part move relative to other parts already assembled?
3. Must the part be of a different material or be isolated from the other parts already assembled?
4. Can parts or operations be eliminated & their functions be incorporated in other parts?

Candidate for
Elimination

Item function

Item has no function except to:

- Fasten or secure other items
- Connect other items
- Item has other function

Theoretically
Necessary

Candidate for
Elimination

Minimum part criteria

Item must be separate from all other items
assembled, because:

- Base part (usually only the first)
- Moves relative to all other items
- Must be a different material
- Separate to allow assembly
- No fundamental reason exists

TRIZ TRIMMING

The TRIZ trimming concept means that a component of a system or a process is eliminated and its useful functions transferred to other components.

- A function model describes the relationships between system elements in terms of the functions that they perform.
- When a function model represents a device, it captures what each component of the device does, as well as how well it does it, to promote the overall goal of the device.

- Furthermore, the function model captures the unnecessary and harmful functions that are also performed, or the poorly executed required functions.
- Note: The function model is not a flowchart, but it might look like one. The function model does not capture WHEN the various interactions occur in time. Instead, it emphasizes all the states or relationships of the system throughout its operation cycle.

- The trimming decision may be made based on the three inputs:
 1. functional significance,
 2. cost and
 3. the “headache index”, which is an integral measure of complications related to operation and maintenance of the component.

- The **target** of a device is the primary reason why the device was designed.
- The main function of a device is performed on the target.
- The target is an element that exists outside the device that you are analyzing.
- Use the following guideline to identify the device target: The target is the recipient, or the object, of the main function of an engineering system.

- The Function Rank is an indicator of the relative importance of the functions that are performed by the device components .
- The components that function on the target most directly are considered to be more valuable in the device, and have the highest Functional Rank.

One of the trimming rules can be formulated as follows:

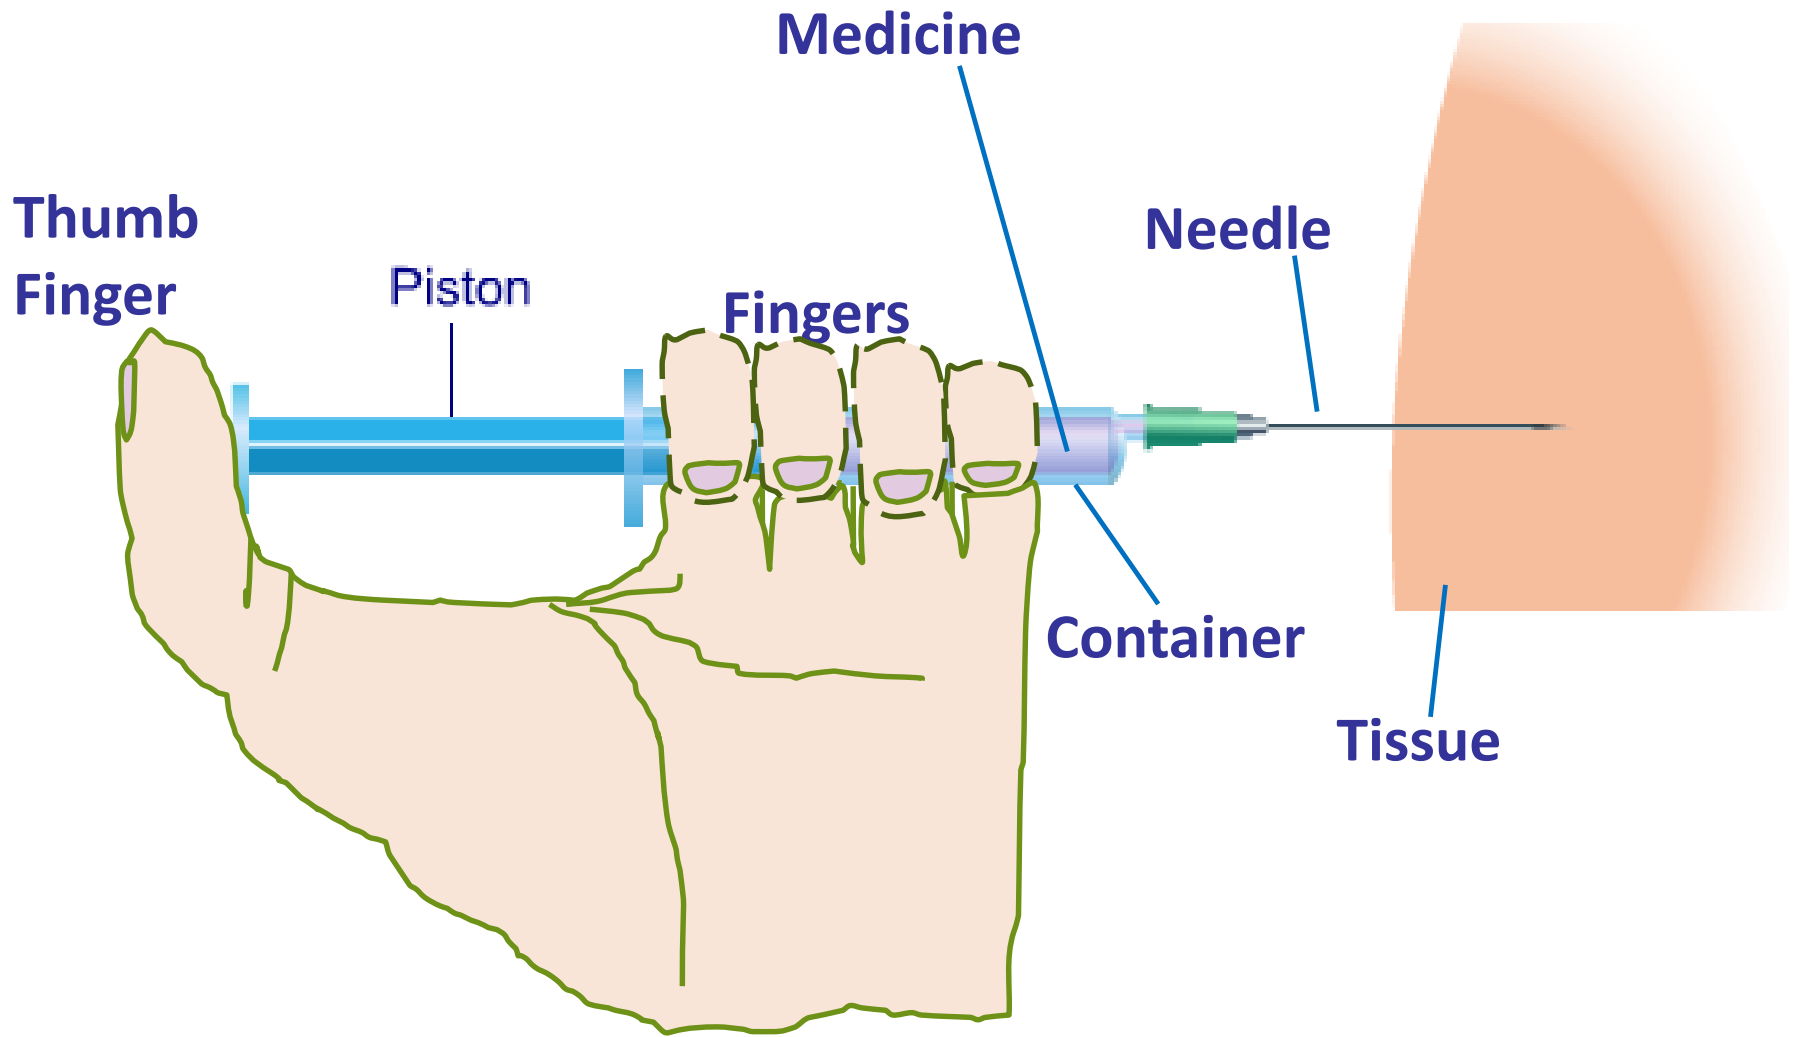

- “ If functional significance of a component is low, and its cost is medium, and its trouble index is medium, then it is a likely candidate for trimming”.
- This is usually done by ranking components on a scale from 0 to 1 (or, 0 to 100), with the first candidate to be trimmed having the highest rank (the largest number).

- If a component is "functionally distant" from the target (that is, it acts on the target through many other model elements), it is considered less important to the device and is therefore assigned a higher priority for being simplified (or trimmed) from the design.

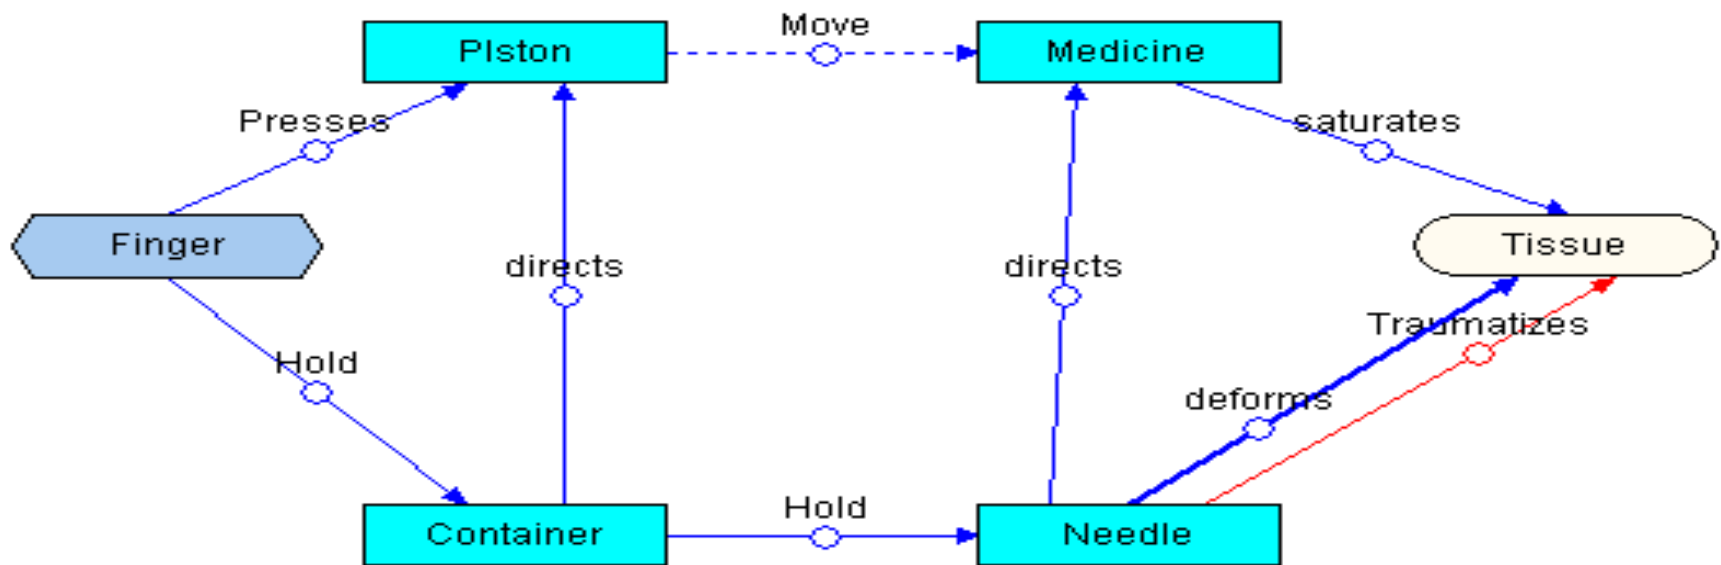

- What is the main function of a toothbrush system?
- Contrary to everyday thinking, it is not to brush teeth. If you consider teeth carefully, no parameter of the teeth is modified by the toothbrush.
- In fact, the toothbrush is designed to act on the plaque which coats the teeth.
- Plaque is the element on which the toothbrush acts directly.

- Therefore the main function of the toothbrush system is to remove plaque.
- The parameter of the plaque that is affected by its removal is the amount of plaque.
- Since plaque is the object of the main function, it is the target of this system.
- A system can have several main functions, and therefore it can have multiple targets.
- For example, a toothbrush can also be designed to massage gums.

Example Syringe

- A device model is an abstract representation of a device in terms of its components and its environmental elements (or elements of the super system), as well as the functions that are performed by these elements.

- An** - auxiliary function of rank "n"
- H** - harmful function

Problem List Table

Nr	Name	Group
3.1	Improvement of "deforms" (Needle - Tissue)	Efficiency increase
3.2	Improvement of "Move" (Pliston - Medicine)	Efficiency increase
4.1	Elimination of "Traumatizes" (Needle - Tissue)	Quality increase

3.1 Problem name: Improvement of "deforms" (Needle - Tissue) *Problem description:*

3.2 Problem name: Improvement of "Move" (Piston - Medicine) *Problem description:*

Function Rank

	Value
Container	5.00
Medicine	10.00
Needle	6.50
Piston	3.33

Problem Rank

	Value
Container	0.00
Medicine	0.00
Needle	10.00
Piston	5.19

Cost Rank

	Value
Container	0.09
Medicine	0.05
Needle	0.06
Piston	0.12

Maximum Value

- $V = F \cdot F / (P + C)$. The most valuable components have the highest Function Rank and the lowest Problem Rank and Cost. To use this formula, you must enter the approximate values or actual values of the Cost parameter for each component.

Minimum Cost

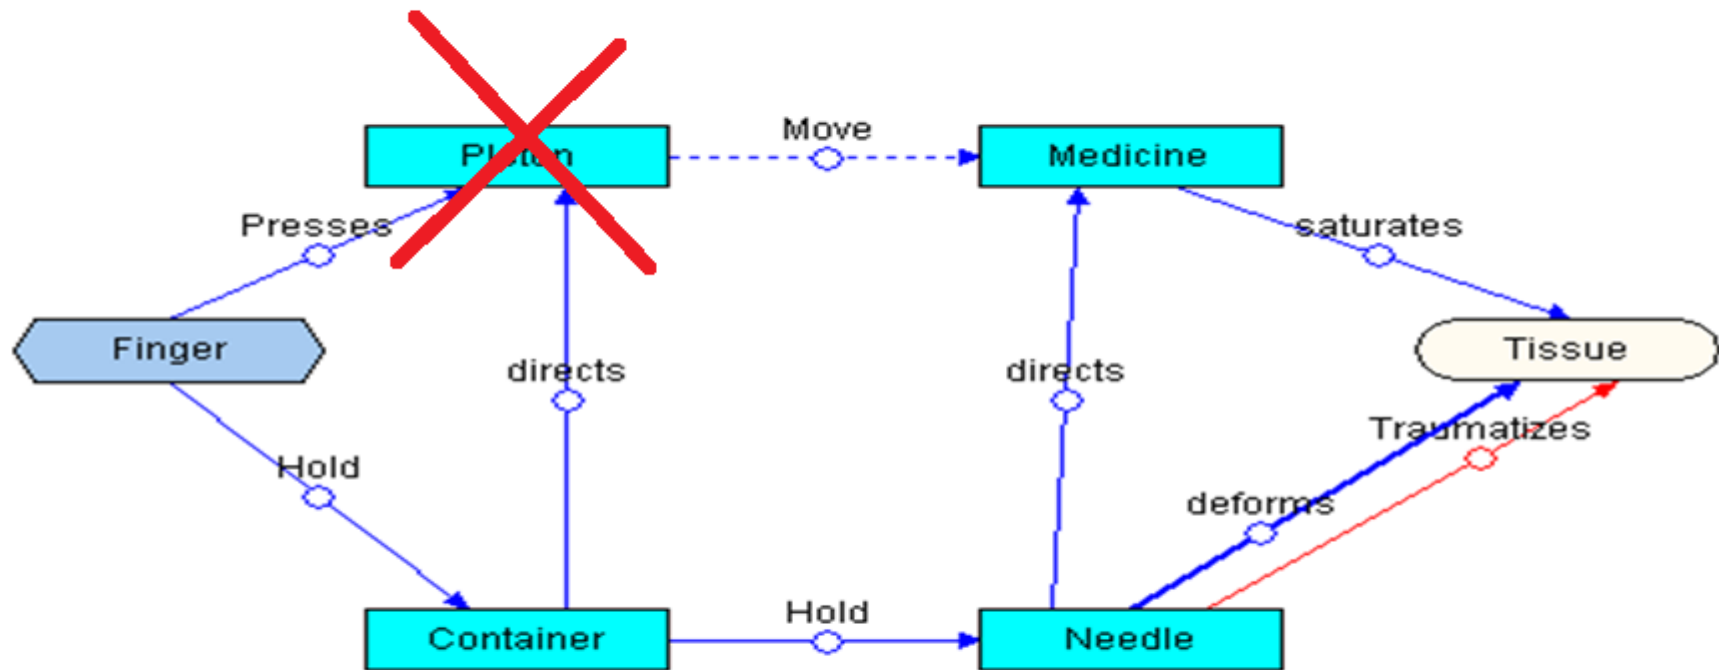

- $V = 1/C$. The highest-rated components have the lowest Cost. To use this formula, you must enter the values of the Cost parameter for each component.

Minimum Problems

- $V = 1/P$. The highest-rated components have the lowest Problem Rank. Since the Problem Rank is calculated automatically by the software, you do not need to enter any values manually.

- In this step you do the following:
 - Define the parts of the device and their interactions
 - (Optional) Define any custom diagnostic parameters for the model components and enter their values (most likely you'll find the predefined parameters are sufficient)
 - Select or define the formula that will be used to calculate the relative value of the components in your model.

- In this step you solve problems, validate concepts, and rank solutions either by hand or using software.
- This example was run using Solution Manager in Goldfire Innovator Software from IHS.

Piston less Syringe

3.1 Problem name: Elimination of "Traumatizes" (Needle - Tissue) *Problem description:*

How to eliminate function **Traumatizes Tissue?**

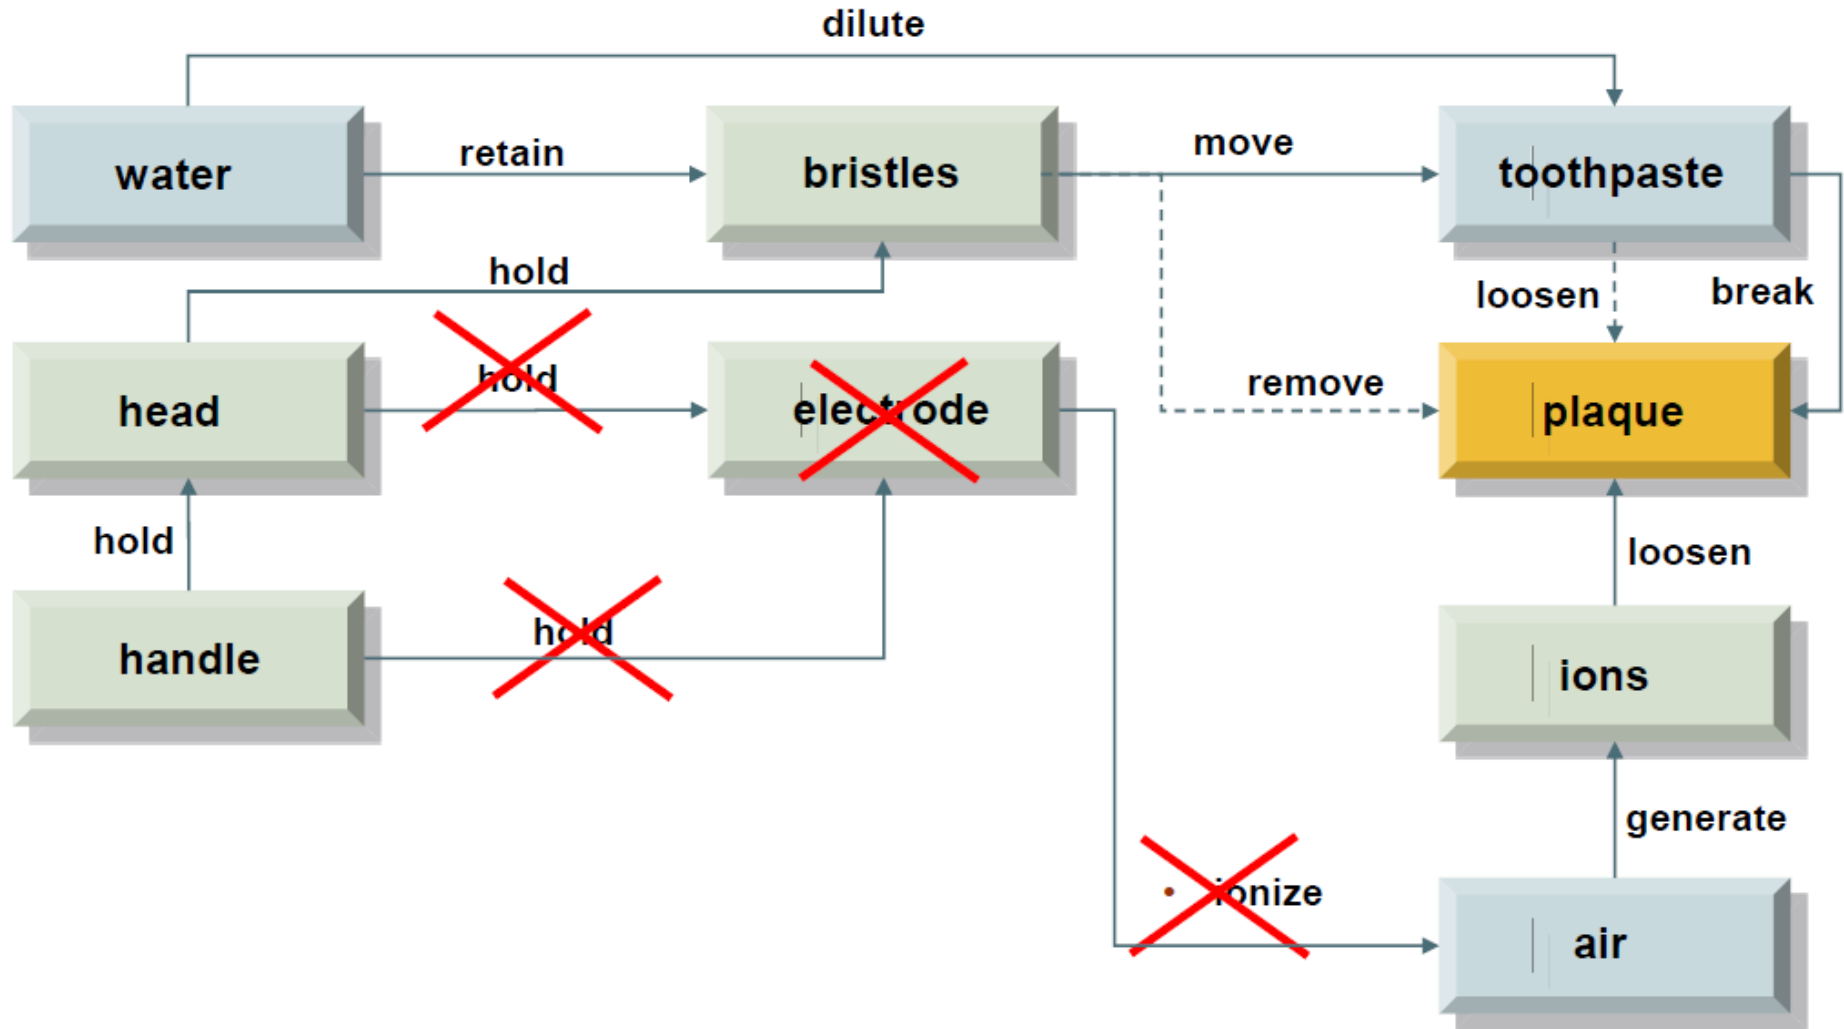

KEY TAKE AWAY- Function Models got you to this point.
 The Needle actually **traumatizes** the tissue.
 This a Problem Statement.

That is something your TEAM can find solutions for instead of just making smaller and sharper needles!

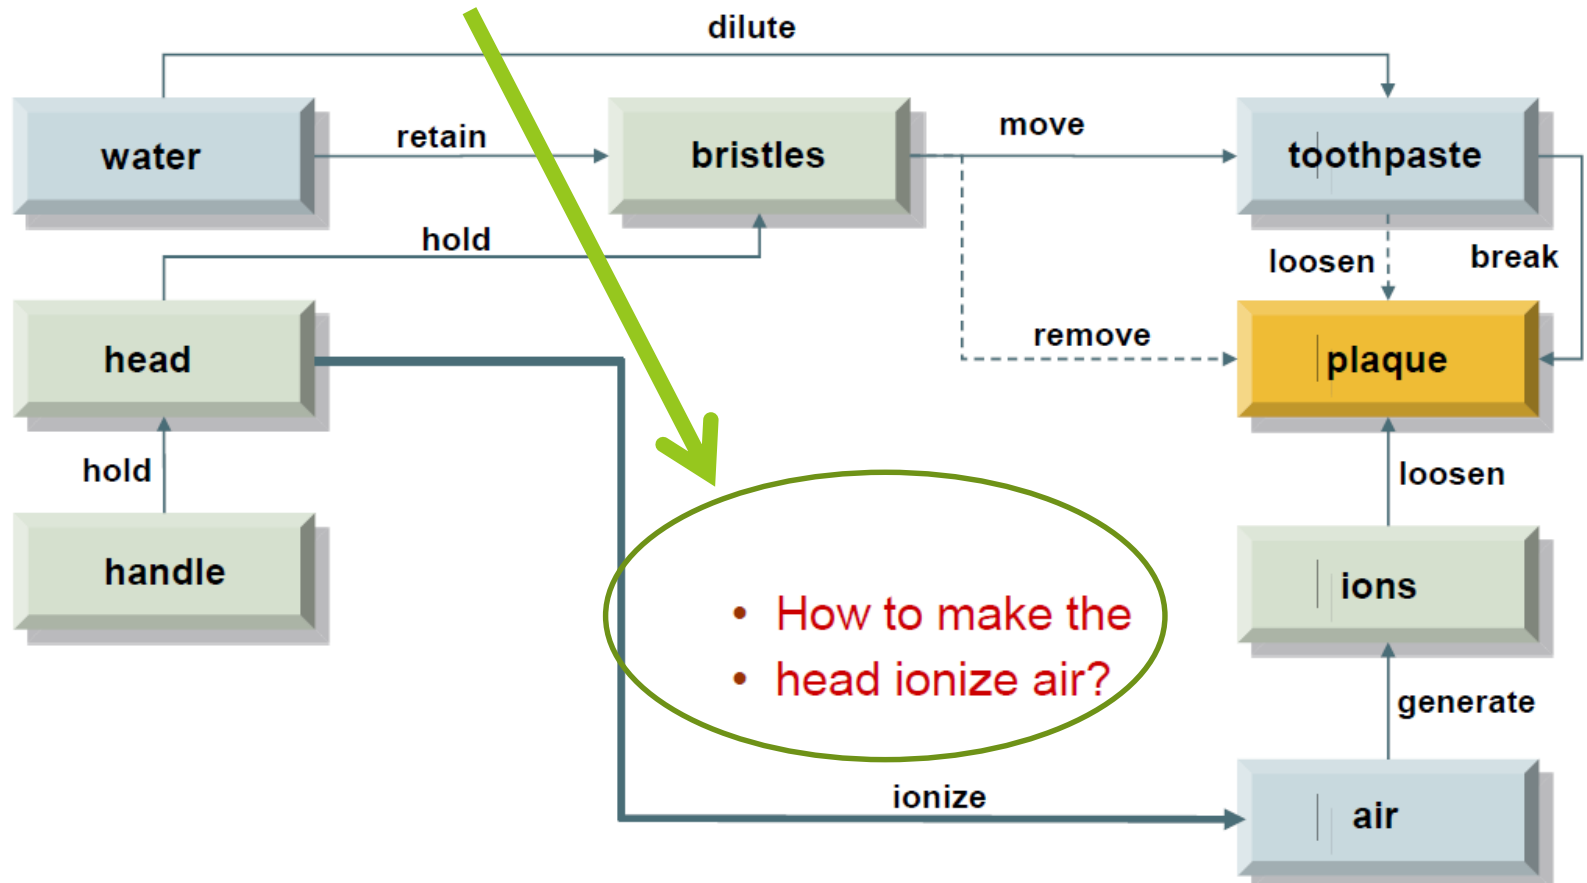

- A toothbrush described in a patent, consists of a head containing bristles, and a handle that holds the head.
- The handle and head also hold an electrode that is powered by a battery inside the handle
- The electrode ionizes air and aids in easy plaque removal

(*) With permission from TRIZ for Patent Strategies from Sergei Ikonenko, TRIZ Master, Dr-Eng, PhD, professor (adjuncts), MIT

KEY TAKE AWAY- Function Models help show what needs to be solved now. **NOT “HOW to remove plaque.”** Plaque removal will be end result! This Problem Statement can change a team’s direction and approach to solving this problem. How to ionize something is a different direction your TEAM will research instead of just creating new bristles.

(*) With permission from TRIZ for Patent Strategies from Sergei Ikonenko, TRIZ Master, Dr-Eng, PhD, professor (adjuncts), MIT

The toothbrush head surface is covered with an alloy that, when in contact with toothpaste and water, works as an active couple and generates voltage.

As a result, the head itself ionizes the air near the plaque.

Problem: Labels fall off power tools over time & don't stick well to plastic housings.

DFA-Mold or cast the label information in the plastic housings, no need to assemble label, because the label is part of the housing now produced at injection molding process level and now permanently marked, no need for label, no label storage, no concern about loss and no mis-labeled products.

Problem: Metal Frame of solar panel are difficult to assemble, screwed together, glued or taped to glass panel and must be grounded to metal frame (rack) on roof.

DFA-What if glass was formed in Pyrex cake pan shape? Now glass could act as frame as well. No need to ground (since no metal frame), no glue, no screws, and no frame assembly.

Huge cost savings.

Solar Frame Assembly & Packaging Issues

- Trim “un-needed” parts to evaluate what could be eliminated in solar panel design and solar panel packaging for DFA.

- Implement DFA, and TRIZ Trimming
- Lunch-n-Learns with diverse teams, breakdown problems and the company's walls.
- Find and use problem solving Champions & successes to spread the word within your company.
- Break problems down to functions (nouns) and list relationships between components into Useful, Harmful, Necessary, Adequate, Inadequate actions (verbs).

- Conduct more internal specific DFMA, Trimming, and TRIZ related training and use it when problem solving.
- Identify Action Words used in your industry: heat, vibrate, excite, support, burn, insulate, corrode, dissolve, align, isolate, penetrate, detonate, wear, hold, reflect, contain, protect.....
- Identify Functions that are reoccurring issues, then start with your of components around that problem component or area.

- Create Function Models for your problem areas, your most challenging processes, the habitual RCAs, the company's or vendor's most costly parts or assemblies.
- You know which parts I am talking about, and you're thinking about them right now.

- DFA, TRIMMING, and TRIZ along with other simple methods of problem solving and function modeling can help you and your company produce better products in less time, that cost less to produce, manufacture and assemble.
- Better, Cheaper, Faster and more Robust- If you are not doing it for your industry's products, your competitors probably are.

Examples

- Cutting tool
- Printing mechanism
- Bearing
- Automobile wheels

Problem: How to improve action action from component1 to component2 ?

Solution: Try to improve the action action by segmenting component1 or component2 into two or more parts, into a powder, into a liquid, etc.

component1

- - - - -
 action
 - - - - -

component2

◀ Previous Next ▶

Example: Automobile wheels

A vehicle has four separate wheels taking its weight. Such a system is not appropriate for heavy vehicles. Wheels may cut deep into soft soil and the vehicle may bog down.

An automobile is fitted with multiple wheels arranged in rows. These vehicles may move well off-road.

A continuous tread runs around the outside of the vehicle wheels. The wheels roll along the inner surface of the belt, which uniformly distributes the vehicle's weight. The vehicle travels cross-country easily.

A moving air-cushion vehicle rests on a layer of compressed air between its bottom and the road. A propeller engine blows the air underneath the vehicle. These vehicles can attain high speeds and may move on any surface.

Examples

- Automobile tire
- Engine cooling**
- IC radiative cooler
- Crystal cooling

Problem: How to improve action from to ?

Solution: Try to improve the action by modifying the surface(s) of component 1 or component 2 with protrusions, active pores, etc.

◀ Previous Next ▶

Example: Engine cooling

with introduced.

The surface of the combustion engine cylinder is given ribs. The surface area of the cylinder increases, which improves the heat removal.

All heated components of the combustion engine are ribbed: exhaust pipe, fixing elements, etc. This intensifies heat removal, cooling the engine efficiently.

For ejector cooling, the engine cylinder is enclosed in a housing. The exhaust gas drags the heated air out of the housing. This supplies cool air. Thus, the cylinder surface is efficiently cooled.

Examples

- Steering-wheel shaft
- Door
- Computer keyboard
- Mounting crystals on the substrate
- Mobile telephone

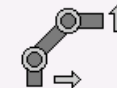

Problem: How to improve action action from component1 to component2 ?

Solution: Try to improve the action action by modifying the degrees of freedom of component1 or component2.

component1 -----○----- component2

◀ Previous Next ▶

Example: Mobile telephone

A two-piece mobile phone has two units that are connected telescopically. Its antenna is retractable. This improves its compactness.

A three-piece mobile phone has several distinct units. This is even more compact.

The middle portion of a mobile phone casing is flexible. Such a telephone is foldable. The convenience and reliability increase.

A mobile phone has a flexible liquid crystal display that may be retracted. This increases compactness, as the

TRIZ Patterns of Evolution for PRODUCTS

What is TRIZ? How are Trimming and DFA Related?

- Recommended Book: **“And suddenly the inventor appeared: TRIZ, the theory of inventive problem solving”**
 - Altshuller, G. (2004), Worcester, MA Technical Innovation Center www.aitriz.org
- TRIZ originated in USSR developed by Genrich Altshuller (1926-1998).
- After WWII, the Soviet Government agreed to give the German Patent Library to the US in exchange for various pieces of industrial equipment. Altshuller claimed equipment will be worthless in 20 years, but the patents would remain valuable for MANY years past the 20 years.
- TRIZ is considered an empirical method of innovation. Step by step methodology that can lead to a repeatable process. It is based upon an exhaustive patent search that was conducted by Altshuller.
- Its premise is innovation can be taught.
- This goes contrary to popular opinion. Most people feel innovation is emotionally based and only happens as a Eureka! moment. That it cannot be structured and you must be gifted with a creative mind.

Trimming and DFA are both ways to approach an Ideal Final Result, the best or most simple way to do something.

Facing a contradiction- begin with identifying some of the 39 TRIZ engineering parameters

What physical things can change, what can designers CHANGE?

- | | | |
|-------------------------------|--------------------------------------|--------------------------------------|
| 1. Weight of moving object | 15. Durability of moving object | 29. Accuracy of manufacturing |
| 2. Weight of nonmoving object | 16. Durability of nonmoving object | 30. Harmful factors acting on object |
| 3. Length of moving object | 17. Temperature | 31. Harmful side effects |
| 4. Length of nonmoving object | 18. Brightness | 32. Manufacturability |
| 5. Area of moving object | 19. Energy spent by moving object | 33. Convenience of use |
| 6. Area of nonmoving object | 20. Energy spent by nonmoving object | 34. Reparability |
| 7. Volume of moving object | 21. Power | 35. Adaptability |
| 8. Volume of nonmoving object | 22. Waste of energy | 36. Complexity of device |
| 9. Speed | 23. Waste of substance | 37. Complexity of control |
| 10. Force | 24. Loss of information | 38. Level of automation |
| 11. Tension, pressure, stress | 25. Waste of time | 39. Productivity |
| 12. Shape | 26. Amount of substance | |
| 13. Stability of object | 27. Reliability | |
| 14. Strength | 28. Accuracy of measurement | |

What Parameter improves and which parameter worsens as a result?

*Select which parameter number is **improving**, and which is getting **worse**.*

TRIZ-Contradiction Matrix to Generate Ideas You Can

Use the 40 Principles

- | | | |
|-------------------------------|----------------------------------|------------------------------------|
| 1. Segmentation | 15. Dynamics | 29. Pneumatics and hydraulics |
| 2. Taking out | 16. Partial or excessive actions | 30. Flexible shells and thin films |
| 3. Local quality | 17. Another dimension | 31. Porous materials |
| 4. Asymmetry | 18. Mechanical vibration | 32. Color changes |
| 5. Merging | 19. Periodic action | 33. Homogeneity . |
| 6. Universality | 20. Continuity of useful action | 34. Discarding and recovering |
| 7. "Nested doll" | 21. Skipping | 35. Parameter changes |
| 8. Anti-weight | 22. "Turn Lemons into Lemonade" | 36. Phase transitions |
| 9. Preliminary anti-action | 23. Feedback | 37. Thermal expansion |
| 10. Preliminary action | 24. 'Intermediary' | 38. Strong oxidants |
| 11. Beforehand cushioning | 25. Self-service | 39. Inert atmosphere |
| 12. Equipotentiality | 26. Copying | 40. Composite materials |
| 13. 'The other way round' | 27. Cheap short-living objects | |
| 14. Spheroidality - Curvature | 28. Mechanics substitution | |

Ways or concepts to make those changes or to spark NEW ideas

Note: Multiple principles may apply to solving the contradiction, the top level solutions for resolving this conflict can be identified in a matrix grid. More than one set of parameters may apply to the contradiction.

Analyze the Problem – Use Functional Models

Understand the Function of your System and its Components

analyze

- What does the system do?
- What does each element of the system do?
 - What is the object being acted on?
- What is the energy in the system
 - How is the energy being transmitted
 - What tool is delivering the energy and how is it being controlled?
- Are the actions
 - > Useful?
 - > Harmful?
 - > Necessary?
 - > Adequate?
 - > Inadequate?
- Where are there idle resources?

KEY TAKE AWAY- Build and Use Function Models

1. What is a Function Model?

A visual pictogram that breaks a problem down to its key component features and then links relationships of one feature to other features.

2. When and Where should you use Function Models?

Product Design, Competitive analysis, Value analysis, cost savings, understanding steps in current Systems or Process or Product RCAs, Trimming, FMEAs, problem solving, DFA, DFM, LEAN, TRIZ, and Project Management.

3. Why should you use Function Models?

Break problem down to solve-able pieces and use digital public domain and existing corporate knowledge to help you find cause and effect relationships. Helps everyone UNDERSTAND the relationships components have on each other and the systems.

4. Who should use Function Models?

Engineers, managers, designers, marketing, manufacturing

5. How much could companies save using Function Models in daily problem solving?

10-20% of Research analysis and problem solving could = \$millions per year
